Ultrasound-guided trigeminal nerve block via the coronoid approach allows blockade of the maxillary and mandibular nerve as they pass through the pterygopalatine space. The simplicity and safety of this technique lend itself to the diagnosis and treatment of a variety of painful conditions subserved by the maxillary and mandibular divisions of the trigeminal nerve (Table 7.1).

Methods: Fifteen patients were treated with ultrasound-guided trigeminal nerve block with local anesthetic and steroids placed into the pterygopalatine fossa. Results: All patients achieved complete sensory analgesia to pin prick in the distribution of the V2 branch of the trigeminal nerve and 80% (12 out of 15) achieved

Ultrasound imaging to localize
foramen for superficial trigeminal
nerve block was first described by
Tsui. He described using the
discontinuity of the frontal, maxilla, and
mental bones to locate the
supraorbital, infraorbital, and mental
foramen using a high-frequency linear
transducer.

Ultrasound Guidance Technique for Superficial Trigeminal Nerve Blocks

The ultrasound-guided approach to locate the landmark foramina for superficial trigeminal nerve block is feasible. Using a high-frequency linear transducer, bone appears as a hyperechoic linear edge (white line) with an underlying anechoic (dark) shadow.

Ultrasound-guided injections in the pterygopalatine fossa (PPF) to block the trigeminal nerve divisions and sphenopalatine ganglion have been described but a consensus has yet to be reached over the ideal approach.

Conclusion: This cadaveric investigation suggests that ultrasound guidance can be used to inject the peripheral trigeminal nerve with a high degree of accuracy. Clinicians should consider using ultrasound guidance to inject the trigeminal nerve for diagnostic or therapeutic purposes.
